S/N	ZNS NO.	EDITION	TITLE AND SCOPE	STATUS	PAGES	PRICE (TSH)
			<p>This standard specifies a method for the enumeration of <i>E. coli</i> and coliform bacteria in water. The method is based on the growth of target organisms in a liquid medium and calculation of the "Most Probable Number" (MPN) of organisms by reference to MPN tables. This method can be applied to all types of water including those containing an appreciable amount of suspended matter and high background counts of heterotrophic bacteria. However, it must not be used for the enumeration of coliform bacteria in marine water. When using for the enumeration of <i>E. coli</i> in marine waters, a 1→10 dilution in sterile water is typically required, although the method has been shown to work well with some marine waters that have a lower than normal concentration of salts. In the absence of data to support the use of the method without dilution, a 1→10 dilution is used.</p> <p>This method relies upon the detection of <i>E. coli</i> based upon expression of the enzyme β - D-glucuronidase and</p>			

S/N	ZNS NO.	EDITION	TITLE AND SCOPE	STATUS	PAGES	PRICE (TSH)
			<p>consequently does not detect many of the enterohaemorrhagic strains of <i>E. coli</i>, which do not typically express this enzyme. Additionally, there are a small number of other <i>E. coli</i> strains that do not express β-D-glucuronidase.</p> <p>The choice of tests used in the detection and confirmation of the coliform group of bacteria, including <i>E. coli</i>, can be regarded as part of a continuous sequence. The extent of confirmation with a particular sample depends partly on the nature of the water and partly on the reasons for the examination. The test described in this part of ZNS 520-2:2022 provides a confirmed result with no requirement for further confirmation of positive wells.</p> <p>NOTE: While this method describes the use of an enumeration device that is commercially available, the medium described here can also be used in a standard MPN format.</p>
