## Foreword

Development of the East African Standards has been necessitated by the need for harmonizing requirements governing quality of products and services in the East African Community. It is envisaged that through harmonized standardization, trade barriers that are encountered when goods and services are exchanged within the Community will be removed.

The Community has established an East African Standards Committee (EASC) mandated to develop and issue East African Standards (EAS). The Committee is composed of representatives of the National Standards Bodies in Partner States, together with the representatives from the public and private sector organizations in the community.

East African Standards are developed through Technical Committees that are representative of key stakeholders including government, academia, consumer groups, private sector and other interested parties. Draft East African Standards are circulated to stakeholders through the National Standards Bodies in the Partner States. The comments received are discussed and incorporated before finalization of standards, in accordance with the principles and procedures for development of East African Standards.

East African Standards are subject to review, to keep pace with technological advances. Users of the East African Standards are therefore expected to ensure that they always have the latest versions of the standards they are implementing.

The committee responsible for this document is Technical Committee EASC/TC 035, *Steel and steel products*.

This fourth edition cancels and replaces the third edition (EAS 134:2019), which has been technically revised.

Attention is drawn to the possibility that some of the elements of this document may be subject of patent rights. EAC shall not be held responsible for identifying any or all such patent rights.

# Cold formed structural steel sections — Specification

## 1 Scope

This Final Draft East African Standard specifies requirements and sectional properties of cold formed structural steel sections of thickness of 1 mm to 8 mm for use in structural and general engineering applications.

## 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 148-1, *Metallic materials — Charpy pendulum impact test — Part 1: Test method*

ISO 377, *Steel and steel products — Location and preparation of samples and test pieces for mechanical testing*

ISO 404, *Steel and steel products — General technical delivery requirements*

ISO 1461, *Hot dip galvanized coatings on fabricated iron and steel articles — Specifications and test methods*

ISO 3575, *Continuous hot-dip zinc-coated and zinc-iron alloy-coated carbon steel sheet of commercial and drawing qualities*

ISO 4998, *Steel sheet, zinc-coated and zinc-iron alloy-coated by the continuous hot-dip process, of structural quality*

ISO 6892-1, *Metallic materials — Tensile testing — Part 1: Method of test at room temperature*

ISO 8492, *Metallic materials — Tube — Flattening test*

ISO 8493, *Metallic materials — Tube — Drift-expanding test*

ISO 9364, *Steel sheet, 55 % aluminium-zinc alloy-coated by the continuous hot-dip process, of commercial, drawing and structural qualities*

ISO 10799-2, *Cold-formed welded structural hollow sections of non-alloy and fine grain steels — Part 2: Dimensions and sectional properties*

ISO 12633-1, *Hot-finished structural hollow sections of non-alloy and fine grain steels — Part 1: Technical delivery conditions.*

ISO 12633-2, *Hot-finished structural hollow sections of non-alloy and fine grain steels — Part 2: Dimensions and sectional properties*

ISO 12944-5, *Paints and varnishes — Corrosion protection of steel structures by protective paint systems Part 5: Protective paint systems*

ISO 14347, *Fatigue — Design procedure for welded hollow-section joints — Recommendations*

ISO 16172, *Steel sheet, metallic-coated by the continuous hot-dip process for corrugated steel pipe*

### 3 Terms and definitions

No terms and definitions are listed in this document.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <http://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org>

### 4 Symbols and/or abbreviated terms

The following symbols shall be used. Units for dimensions are in millimetres and those for section properties in centimetres.

— t	section thickness	mm
— p	distance from edge to section centre of gravity	- cm
— A	sectional area	- cm <sup>2</sup>
— Z	section modulus of section I/p	- cm <sup>3</sup>
— I	second moment of area	- cm <sup>4</sup>
— r	radius of gyration of section $\sqrt{I/A}$	- cm
— x, y	with reference to x or y axis	
— w	mass per linear metre	- kg/m
— L	length	- m.

### 5 Dimensions and tolerances

#### 5.1 Dimensions and section properties

5.1.1 Dimensions and section properties shall be as given in the relevant tables and figures in Annex A.

5.1.2 Other dimensions and their sectional properties may be produced according to ISO 10799-2 or ISO 12633-2.

#### 5.2 Tolerances

Tolerances for characteristic properties shall be as given in Table 1.

**Table 1 — Tolerances for characteristic properties**

Characteristic	Tolerance
Outside dimension <sup>a</sup>	±1.5 mm or 2 %, whichever is less
Deviation from straightness	0.17 % of total length
Squareness of corners	90° ± 2°
Twist	Not to exceed 2 mm ± 0.5 mm per metre
Concavity/convexity	Maximum 0.8 % or 0.5 mm whichever is less for square and rectangular hollow sections
Outside bend radii for right angle bends	<ul style="list-style-type: none"> <li>• If thickness is less than 6 mm, tolerance is between 1.5 t to 2.5 t</li> <li>• If thickness is between 6 mm to 8 mm, tolerance is between 2 t to 3 t</li> </ul>
Length (6 m):	
• Exact	0 mm and +10 mm
• Standard	0 mm and +50 mm
Thickness	<ul style="list-style-type: none"> <li>• ±3 % for 1 mm</li> <li>• ±7.5 % for above 1 mm</li> </ul>
Mass per metre for 1 mm thick	±3 %
Mass per metre for above 1 mm thick	±6.0 %
Deviation from out of roundness	<ul style="list-style-type: none"> <li>• For D/T ratio ≤ 100: ±2 %</li> <li>• For D/T ratio &gt; 100: ±2 % by agreement</li> </ul>
<sup>a</sup> This tolerance shall be measured at a distance of not less than 100 mm from the end of the section.	

### 5.3 Measurement

#### 5.3.1 General

All external dimensions including out-of-roundness shall be measured at a distance from the end of the hollow section of not less than Diameter (D) for circular sections, Width (B) for square sections or Height (H) for rectangular sections, with a minimum of 100 mm.

#### 5.3.2 Outside dimension

When inspecting circular hollow sections, the D shall be measured directly. The limiting cross-sectional positions for measuring B and H are shown in Figure 1, and shall be in accordance with Annex A. Formulae for calculation of sectional properties of steel hollow sections shall be in accordance with ISO 10799-2 and ISO 12633-2. The cross section area of rectangular and square section shall be calculated as follows:

$$A = \frac{1}{10^2} [2T(B + H - 2T) - (4 - \pi)(Ro^2 - Ri^2)]$$

where

*T* thickness of the section in millimeters

*H, B* side lengths in millimeters

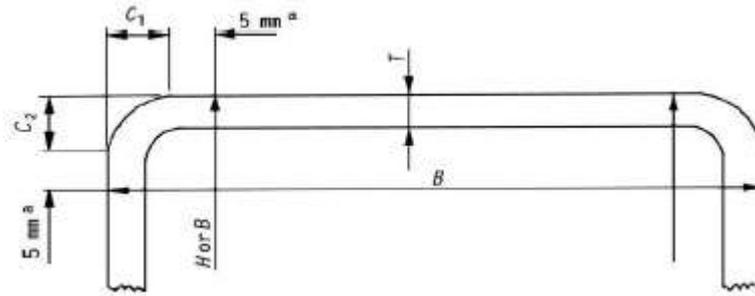

*Ro* outside radius in millimeters

*Ri* inside radius in millimeters

### 5.3.3 Thickness

The thickness (t) shall be measured at a position not less than 2t from the weld. The limiting cross-sectional positions for measuring the thickness of square and rectangular sections are shown in Figure 1.

NOTE Thickness is normally measured within a distance of half of the outside diameter or half of the length of the longer side from the end of the section.

Key

C<sub>1</sub> Concavity

C<sub>2</sub> Convexity

T Thickness (t)

<sup>a</sup> This dimension is a maximum when measuring B or H and a minimum when measuring t.

**Figure 1 — Limiting cross-sectional positions for measuring the dimensions B, H and t for square or rectangular sections**

### 5.3.4 Out-of-roundness

The out-of-roundness, O, of a circular hollow section shall be calculated as follows:

$$\frac{D_{max} - D_{min}}{D} \times 100 \%$$

where

*D* is the nominal outside diameter of a circular hollow section in millimeters;

*D<sub>max</sub>* is the maximum outside diameter in millimeters;

*D<sub>min</sub>* is the minimum outside diameter in millimeters.

### 5.3.5 Concavity and convexity

The concavity ( $C_1$ ) and convexity ( $C_2$ ) of the sides of the square or rectangular hollow section shall be measured as shown in Figure 2.

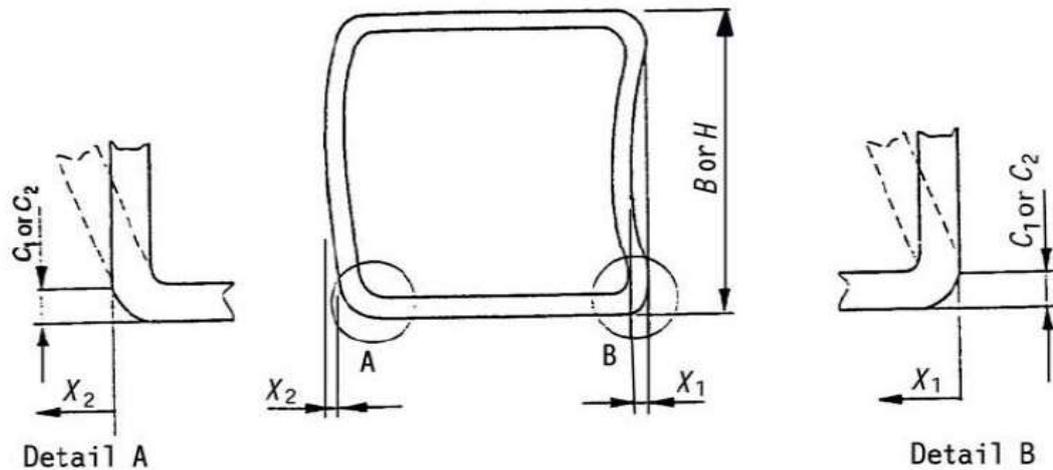

Figure 2 — Measurement of concavity/convexity of square or rectangular hollow sections

$C_1$  shall be calculated as follows:

$$C_1 = \frac{X_1}{B} \times 100 \%$$

or

$$C_1 = \frac{X_1}{H} \times 100 \%$$

where

$X_1$  is the measured value in millimeters of inward deviation from the normal shape

$C_2$  shall be calculated as follows:

$$C_2 = \frac{X_2}{B} \times 100 \%$$

or

$$C_2 = \frac{X_2}{H} \times 100 \%$$

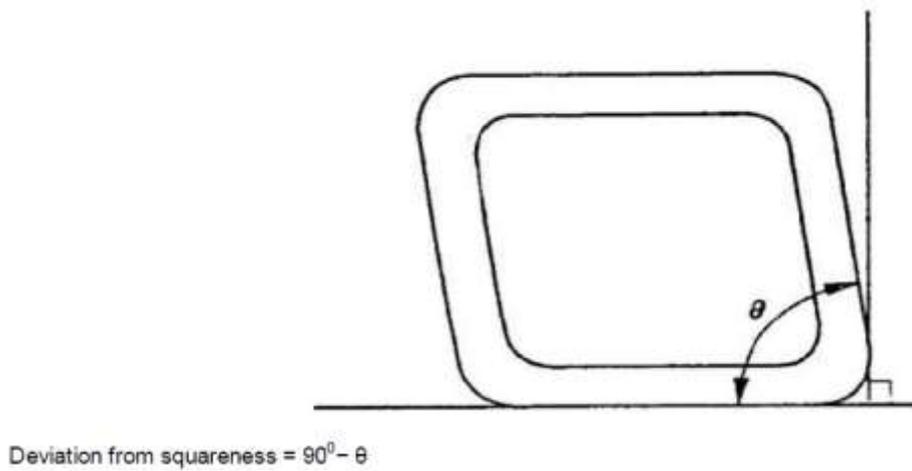

where

$X_2$  is the measured value in millimeters of outward deviation from the normal shape;

$B$  and  $H$  are the dimensions of the sides containing the concavity ( $C_1$ ) or convexity ( $C_2$ ).

### 5.3.6 Squareness

Squareness of the sides of a square or rectangular hollow section shall be measured as difference between  $90^\circ$  and  $\theta$  as shown in Figure 3.

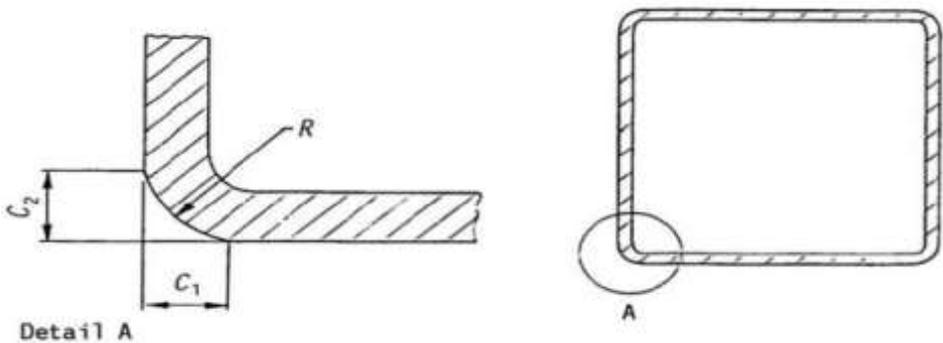

**Figure 3 — Squareness of sides of square or rectangular hollow sections**

**5.3.7 External corner profile**

**5.3.7.1** The external corner profile of a square or rectangular hollow section shall be measured in accordance with 5.3.7.2 or 5.3.7.3.

**5.3.7.2** The corner arc shall be measured with a radius gauge.

**5.3.7.3** The distance between the intersection of the flat side and the corner arc and the intersection of the projections of the flat sides to the corner  $C_1$  and  $C_2$  in Figure 4 shall be measured.

Key

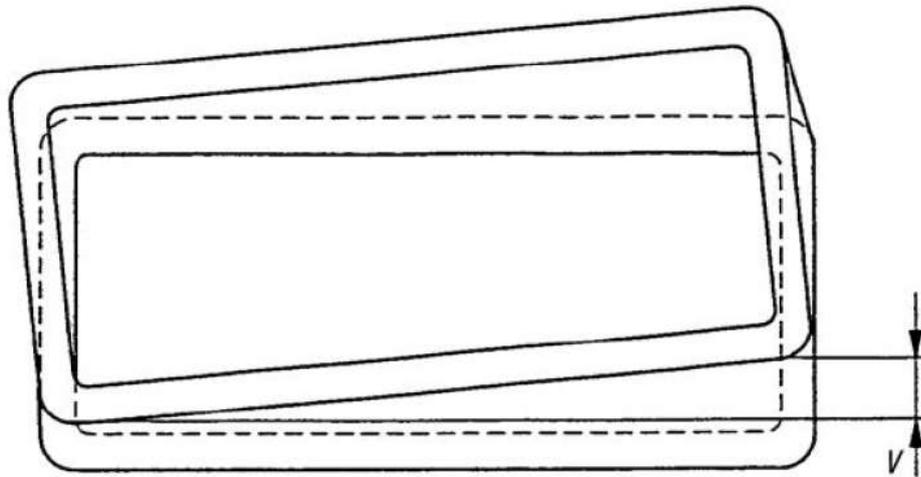

R is the radius of the curvature

**Figure 4 — Outside corner profile of square or rectangular hollow sections**

**5.3.8 Twist**

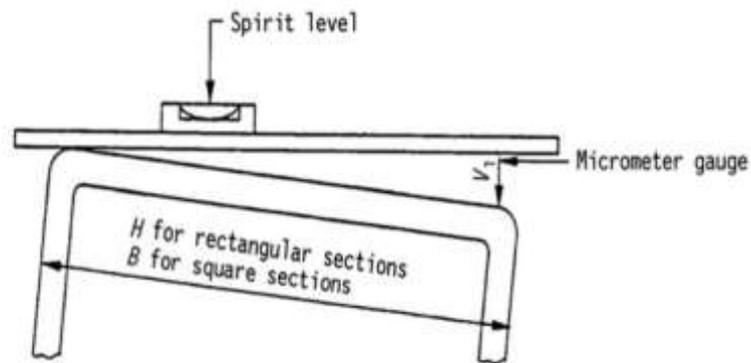

**5.3.8.1** The twist ( $V$ ) in a square or rectangular hollow section shall be determined in accordance with 5.3.8.2 or 5.3.8.3.

**5.3.8.2** The hollow section shall be placed on a horizontal surface with one side at one end pressed against the surface. At the opposite end of the hollow section, the difference in height of the two lower corners from a horizontal surface, ( $V$ ), as shown in Figure 5, shall be measured.

**Figure 5 — Twist of square or rectangular hollow sections**

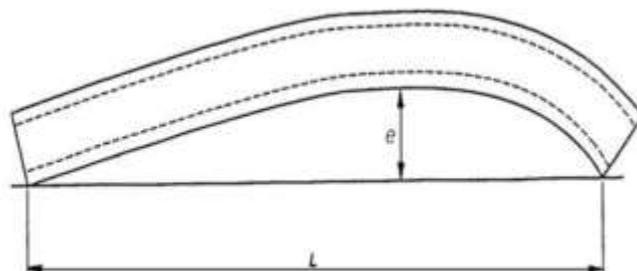

**5.3.8.3** The twist shall be measured with a spirit level and micrometre gauge (screw). The reference length of the spirit level shall be the distance between the intersection of the flat sides and the corner arcs (Figure 6). The twist ( $V$ ) is the difference between the values  $V_1$  (Figure 6) measured at each end of the section.

**Figure 6 — Measurement of twist**

### 5.3.9 Straightness

The deviation from straightness ( $e$ ) of total length ( $L$ ) of a hollow section shall be measured at the point of maximum departure of the hollow section from a straight line connecting its two ends as shown in Figure 7.

**Figure 7 — Measurement of deviation from straightness**

The percentage deviation from straightness shall be calculated as follows:

$$\frac{e}{L} \times 100\%$$

## 6 Compound sections

6.1 Compound sections may be formed by suitably connecting two or more simple sections. For example, an 'I' section can be made from two channels back-to-back, a tube from two inwardly lipped channels lip-to-lip, a 'T' from two angles, etc. Methods of joining sections shall be as specified in ISO 14347.

6.2 Section properties of compound sections may be calculated using the properties of simple sections.

6.3 Compound sections shall be flush at matching joints within 2.0 mm.

## 7 Material requirements

### 7.1 Grade designation

The designation of the grades of material shall be based on minimum permissible yield stress and shall be as given in Table 2.

**Table 2 — Grade designation**

Yield stress N/mm <sup>2</sup> , min.	Designation of grade
210	210
250	250
360	360

### 7.2 Chemical composition

The results of ladle chemical analysis of steel from which a hollow section is manufactured shall comply with appropriate limits given in Table 3. For grade 360, it shall be permissible to add suitable grain-refining elements to achieve the minimum specified tensile stress, but the total content of these elements shall not exceed 0.15 %.

**Table 3 — Ladle chemical analysis limits**

Grade of steel	Content %, max.		
	Carbon	Phosphorous	Sulphur
210	0.20	0.05	0.05
250	0.25	0.06	0.06
360	-	-	0.04

### 7.3 Mechanical properties

The mechanical properties obtained from test samples taken from the hollow section in accordance with ISO 6892-1, shall comply with the requirements given in Table 4. If other grades of steel are used, their mechanical properties shall be as agreed upon between the purchaser and the manufacturer.

**Table 4 — Tensile test requirements**

Grade of steel	Yield stress N/mm <sup>2</sup> , min.	Ultimate tensile strength N/mm <sup>2</sup> , min.	Elongation as a proportion of gauge length %, min.
210	210	340	24
250	250	420	22
360	360	480	20

### 7.4 Coating properties (If applicable)

**7.4.1** The cold formed steel sections may be supplied with or without coatings. When sections are supplied with coatings, sections shall be hot dip galvanized, aluminium zinc coated, pre-painted or in combination.

**7.4.2** When sections are hot dip galvanized, they shall comply with ISO 1461, ISO 3575 or ISO 4998.

**7.4.3** When sections are aluminium zinc coated, they shall comply with ISO 16172 or ISO 9364.

**7.4.4** When sections are pre-painted, they shall comply with ISO 12944-5.

## 8 Test methods

### 8.1 Tensile tests

Tensile test shall be done in accordance with ISO 6892-1.

### 8.2 Impact tests

When requested, impact test shall be done in accordance with ISO 148-1 and shall be assessed in accordance with ISO 404.

### 8.3 Flattening tests

Flattening tests shall be done in accordance with ISO 8492 and shall show no sign of cracking.

### 8.4 Flare tests (Drift-expanding tests)

Flare tests (Drift-expanding tests) shall be done in accordance with ISO 8493 and shall not crack or show any other defect.

### 8.5 Test results

Results shall be rounded to the following precisions:

- a) strength values in Mpa to the nearest whole number;
- b) elongation in % to the nearest whole number;

- c) outside dimension and thickness in mm to the nearest two decimal points; and
- d) mass per unit length in Kg/m to the nearest 3 decimal points.

## 9 Marking

Each piece shall be indelibly and legibly marked at least once per 6-m length with the following information:

- a) manufacturer's name and/or registered trademark;
- b) outside dimension in millimetres;
- c) nominal thickness in millimetres;
- d) steel grade;
- e) country of origin, and
- f) coating information (if applicable).

## 10 Sampling

**10.1** At least one sample shall be selected from the following batch sizes:

- a) a 20-tonne or less batch of sections having outside diameter of less than 90 mm; and
- b) a batch of less than 40 tonnes for all other sections.

**10.2** If the test fails, two more samples shall be drawn from the batch and tested. If one or both test specimens re-tested fail, the whole batch shall be deemed not to have complied with this standard unless all sections in the batch are tested individually.

**10.3** Location of samples and test pieces shall be done in accordance with ISO 377, ISO 10799-1 or ISO 12633-1.

## Annex A (normative)

### Section properties

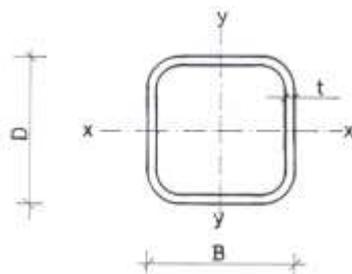

Figure A.1 — Square hollow sections

Formula for dimensions and properties of square hollow sections are provided in ISO 10799-2.

Table A.1 — Dimensions and properties for cold formed square hollow sections

Figure A.2 — Rectangular hollow section

Formula for dimensions and properties of rectangular hollow sections are provided in ISO 10799-2.

Table A.2 – Dimensions and properties for cold formed rectangular hollow sections

Size, B x D mm	Thickness, t mm	Cross Sectional Area, A cm <sup>2</sup>	Mass per metre run, w kg/m	Second moment of area		Radius of gyration		Elastic section modulus	
				Major axis x-x I <sub>x</sub> cm <sup>4</sup>	Minor axis y-y I <sub>y</sub> cm <sup>4</sup>	Major axis x-x R <sub>x</sub> cm	Minor axis y-y R <sub>y</sub> cm	Major axis x-x Z <sub>x</sub> cm <sup>3</sup>	Minor axis y-y Z <sub>y</sub> cm <sup>3</sup>

DRAFT

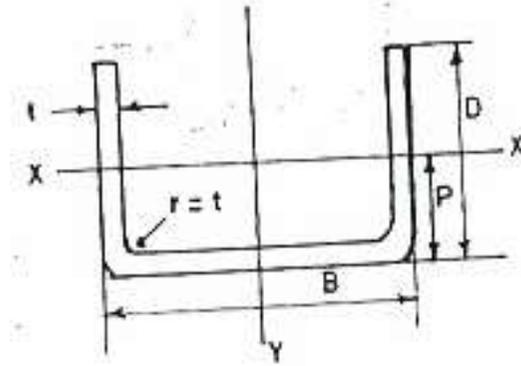

Figure A.3 — Plain channel section

**Formulas for plain channels sections**

**Cross section area, A:**

$$A = [(B+2D-4R_o)t + \pi/2(R_o^2-Rt^2)]/100 \quad [\text{cm}^2]$$

where:

$t$  is the thickness of channel section

$B$  is the base of the channel section

$D$  is the height of the channel section

Nominal external corner radius,  $R_o$ , for calculation is:

for thickness less than or equal to 6 mm:  $2t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $2,5t$  [mm]

for thicknesses more than 10 mm:  $3t$  [mm]

Nominal internal corner radius,  $R_i$ , for calculation is:

for thicknesses less than or equal to 6 mm:  $1t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $1,5t$  [mm]

for thicknesses more than 10 mm:  $2t$  [mm]

**Mass per metre run,  $w$ :**

$$w = 0.785 A \quad [\text{kg/m}]$$

where:

$A$  is the cross section area of the channel section

Figure A.4 — Plain equal angles section

**Formulas for plain equal angles section**

**Cross section area:**

$$A = [(D+B-2R_o)t + \pi/4(R_o^2 - R_i^2)]/100 \quad [\text{cm}^2]$$

where:

$t$  is the thickness of plain equal angles section

$B$  is the base of the plain equal angles section

$D$  is the height of the plain equal angles section

Nominal external corner radius,  $R_o$ , for calculation is:

for thickness less than or equal to 6 mm:  $2t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $2,5t$  [mm]

for thicknesses more than 10 mm:  $3t$  [mm]

Nominal internal corner radius,  $R_i$ , for calculation is:

for thicknesses less than or equal to 6 mm:  $1t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $1,5t$  [mm]

for thicknesses more than 10 mm:  $2t$  [mm]

**Mass per metre run,  $w$ :**

$$w = 0.785 A \quad [\text{kg/m}]$$

where:

$A$  is the cross section area of the plain equal angles section

Figure A.5 — Plain unequal angles

### Formulas for plain unequal angles section

Cross section area:

$$A = [(D+B-2R_o)t + \pi/4(R_o^2 - R_i^2)]/100 \quad [\text{cm}^2]$$

where:

$t$  is the thickness of plain unequal angles section

$B$  is the base of the plain unequal angles section

$D$  is the height of the plain unequal angles section

Nominal external corner radius,  $R_o$ , for calculation is:

for thickness less than or equal to 6 mm:  $2t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $2,5t$  [mm]

for thicknesses more than 10 mm:  $3t$  [mm]

Nominal internal corner radius,  $R_i$ , for calculation is:

for thicknesses less than or equal to 6 mm:  $1t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $1,5t$  [mm]

for thicknesses more than 10 mm:  $2t$  [mm]

**Mass per metre run,  $w$ :**

$$w = 0.785 A \quad [\text{kg/m}]$$

where:

A is the cross section area of the plain unequal angles section

**Table A.5 — Dimensions and properties for cold formed plain unequal angle sections**

Size, B x D mm	Thickness, t mm	Cross sectional Area, A cm <sup>2</sup>	Mass per metre run, w kg/m	Centroid		Axis, x-x			Axis, y-y

Figure A.6 — Cold formed outwardly lipped channel section

**Formulas for cold formed outwardly lipped channel section**

**Cross section area:**

$$A = [t(2C+2D+B-8R_o) + \pi(R_o^2-R_i^2)]/100 \quad [\text{cm}^2]$$

where:

$t$  is the thickness of the outwardly lipped channel section

$B$  is the base of the outwardly lipped channel section

$D$  is the height of the outwardly lipped channel section

$C$  is the length of the outward lip of the channel section

Nominal external corner radius,  $R_o$ , for calculation is:

for thickness less than or equal to 6 mm:  $2t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $2,5t$  [mm]

for thicknesses more than 10 mm:  $3t$  [mm]

Nominal internal corner radius,  $R_i$ , for calculation is:

for thicknesses less than or equal to 6 mm:  $1t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $1,5t$  [mm]

for thicknesses more than 10 mm:  $2t$  [mm]

**Mass per metre run,  $w$ :**

$$w = 0.785 A \quad [\text{kg/m}]$$

where:

$A$  is the cross section area of the outwardly lipped channel section

**Table A.6 — Dimensions and properties for cold formed outwardly lipped channel sections**

Figure A.8 — Zed purlins

### Formulas for cold formed zed purlins

Cross section area:

$$A = [t(2B+2C+D-8R_o) + \pi(R_o^2-R_i^2)]/100 \quad [\text{cm}^2]$$

where:

$t$  is the thickness of zed purlins

$B$  is the base of the zed purlins

$D$  is the height of the zed purlins

$C$  is the length of the lip of the zed purlins

Nominal external corner radius,  $R_o$ , for calculation is:

for thickness less than or equal to 6 mm:  $2t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $2,5t$  [mm]

for thicknesses more than 10 mm:  $3t$  [mm]

Nominal internal corner radius,  $R_i$ , for calculation is:

for thicknesses less than or equal to 6 mm:  $1t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $1,5t$  [mm]

for thicknesses more than 10 mm:  $2t$  [mm]

**Mass per metre run,  $w$ :**

$$w = 0.785 A \quad [\text{kg/m}]$$

where:

$A$  is the cross section area of the zed purlins

**Table A.8 — Dimensions and properties for cold formed structural steel zed purlins**

94	34	64	30	15	2	15	1.0	1.74
94	34	64	30	15	2	15	1.2	2.10
94	34	64	30	15	2	15	1.5	2.60
94	34	64	30	15	2	15	2.0	3.50

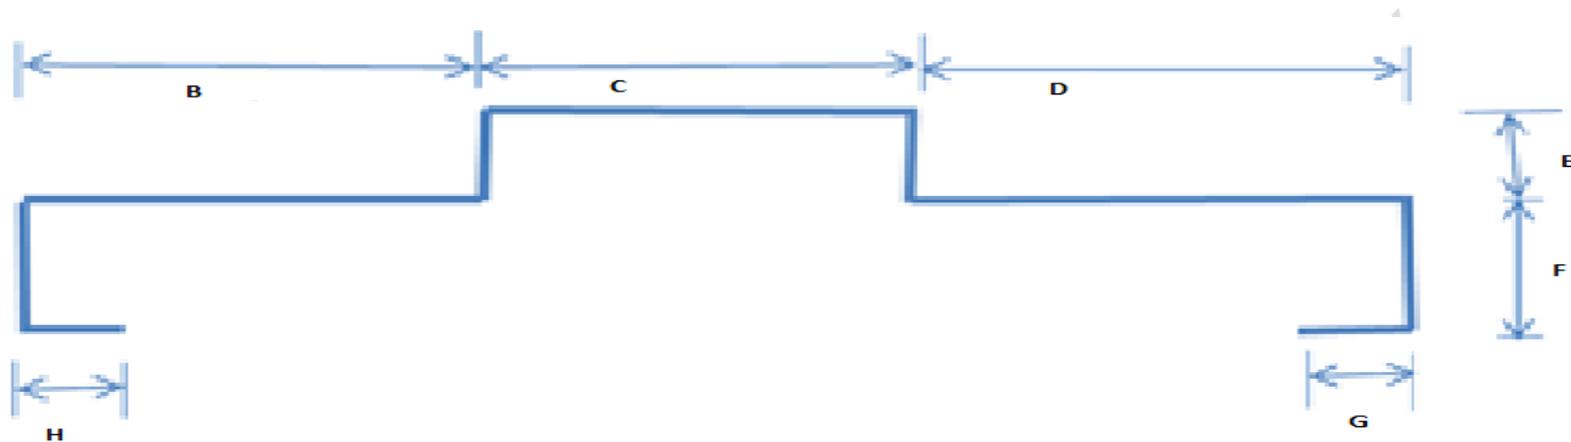

Figure A.11 — Steel door frame

Table A.11 — Dimensions and properties of cold formed steel door frame sections

Nominal size mm	Dimension mm						Thickness mm	Mass kg/m
	B	C	D	E	F	G/H	t	w
150	48	54	48	13.00	30.00	12.00	1.0	1.9
130	45	50	35	15.00	30.15	15.15	1.0	1.8
130	45	50	35	15.00	30.15	15.15	1.2	2.1
130	45	50	35	15.00	30.15	15.15	1.5	2.6
130	45	50	35	15.00	30.15	15.15	2.0	3.5

Remember to insert thickness, t in the figure.

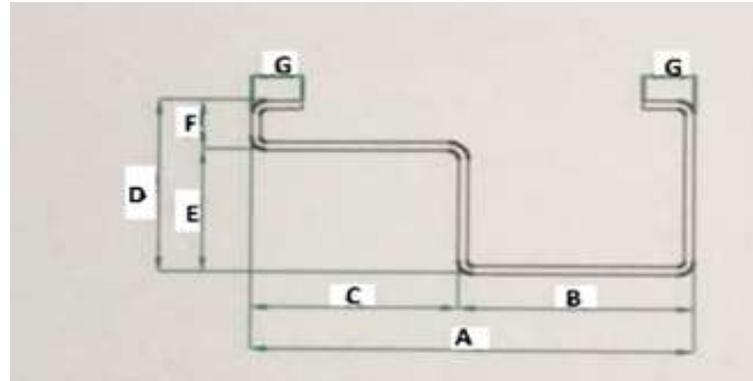

Figure A.12 — Half door frame steel section

**Formulas for Cold formed half door frame steel section**

**Cross section area:**

$$A = [t(2G+F+D+B+C+E-10R_o-2R_i) + 3\pi/2(R_o^2-R_i^2)]/100 \quad [\text{cm}^2]$$

where:

$t$  is the thickness of half door frame steel section

$B, C, D, E, F$  and  $G$  are dimensions of half door frame steel section as given in Figure A.12.

Nominal external corner radius,  $R_o$ , for calculation is:

for thickness less than or equal to 6 mm:  $2t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $2,5t$  [mm]

for thicknesses more than 10 mm:  $3t$  [mm]

Nominal internal corner radius,  $R_i$ , for calculation is:

for thicknesses less than or equal to 6 mm:  $1t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $1,5t$  [mm]

for thicknesses more than 10 mm:  $2t$  [mm]

**Mass per metre run,  $w$ :**

$$w = 0.785 A \quad [\text{kg/m}]$$

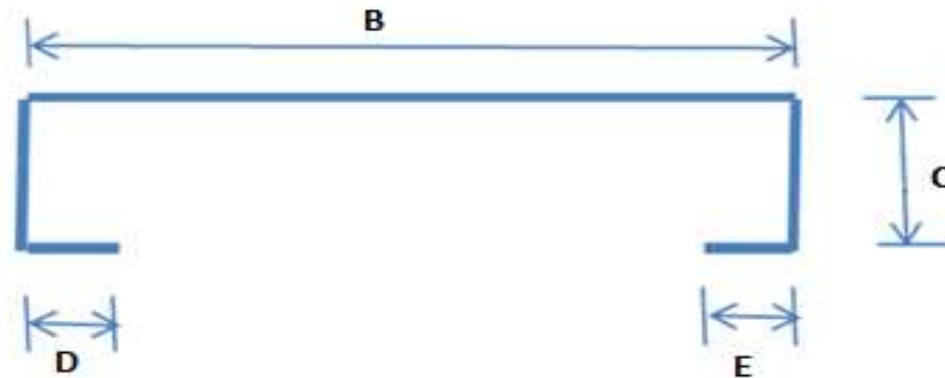

where:

$A$  is the cross section area of the half door frame steel section

**Table A.12 — Dimensions and properties of cold formed half door frame steel section**

Dimension mm							Thickness, $t$ mm	Cross Sectional Area, $A$ cm <sup>2</sup>	Mass per unit length, $w$ kg/m

Figure A.15 — Cold formed inwardly lipped channel section

#### Formulas for Cold formed inwardly lipped channel section

Cross section area:

$$A = [t(2B+2C+D-8R_o) + \pi(R_o^2-R_i^2)]/100 \quad [\text{cm}^2]$$

where:

$t$  is the thickness of inwardly lipped channel section

$B$  is the base of the inwardly lipped channel section

$D$  is the height of the inwardly lipped channel section

$C$  is the length of the lip of the inwardly lipped channel section

Nominal external corner radius,  $R_o$ , for calculation is:

for thickness less than or equal to 6 mm:  $2t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $2,5t$  [mm]

for thicknesses more than 10 mm:  $3t$  [mm]

Nominal internal corner radius,  $R_i$ , for calculation is:

for thicknesses less than or equal to 6 mm:  $1t$  [mm]

for thicknesses more than 6 mm and less than or equal to 10 mm:  $1,5t$  [mm]

for thicknesses more than 10 mm:  $2t$  [mm]

**Mass per metre run,  $w$ :**

$$w = 0.785 A \quad [\text{kg/m}]$$

where:

$A$  is the cross section area of the inwardly lipped channel section

**Table A.15 — Dimensions and properties for cold formed inwardly lipped channel sections**
