			of suspended matter and high background counts of heterotrophic bacteria. However, it must not be used for the enumeration of coliform bacteria in marine water. When using for the enumeration of <i>E. coli</i> in marine waters, a 1→10 dilution in sterile water is typically required, although the method has been shown to work well with some marine waters that have a lower than normal concentration of salts. In the absence of data to support the use of the method without dilution, a 1→10 dilution is used. This method relies upon the detection of <i>E. coli</i> based upon expression of the enzyme β - D-glucuronidase and consequently does not detect many of the enterohaemorrhagic strains of <i>E. coli</i>, which do not typically express this enzyme. Additionally, there are a small number of other <i>E. coli</i> strains that do not express β-D-glucuronidase.			

S/N	ZNS NO.	EDITION	TITLE AND SCOPE	STATUS	PAGES	PRICE (TSH)
			The choice of tests used in the detection and confirmation of the coliform group of bacteria, including <i>E. coli</i>, can be regarded as part of a continuous sequence. The extent of confirmation with a particular sample depends partly on the nature of the water and partly on the reasons for the examination. The test described in this part of ZNS 520-2:2022 provides a confirmed result with no requirement for further confirmation of positive wells. NOTE: While this method describes the use of an enumeration device that is commercially available, the medium described here can also be used in a standard MPN format. ICS 07.100.20

			to areas where people reside and to related long-term land uses. Community response to noise can vary differently among sound sources that are observed to have the same acoustic levels. This part of ZNS 632 describes adjustments for sounds that have different characteristics. The term “rating level” is used to describe physical sound predictions or measurements to which one or more adjustments have been added. On the basis of these rating levels, the long-term community response can be estimated. The sounds are assessed either singly or in combination, allowing for consideration, when deemed necessary by responsible authorities, of the special characteristics of their impulsiveness, tonality, and low-frequency content, and for the different characteristics of road-traffic noise, other

			forms of transportation noise (such as aircraft noise), and industrial noise. This part of ZNS 632 does not specify limits for environmental noise. NOTE 1: In acoustics, several different physical measures describing sound can have their level expressed in decibels (e.g. sound pressure, maximum sound pressure, and equivalent continuous sound pressure). The levels corresponding to these physical measures normally will differ for the same sound. This often leads to confusion. Therefore, it is necessary to specify the underlying physical quantity (e.g. sound pressure level, maximum sound pressure level, and equivalent continuous sound pressure level). NOTE 2: In this part of ZNS 632, quantities are expressed as levels in decibels. However, some countries validly express the underlying physical quantity, such as maximum sound pressure, in pascal or

NOTE 1 – Limitation on the temperature of the cables may be imposed in situations where they may be touched. NOTE 2 – Due to the relatively high conductor temperature, there is a risk of drying out the surrounding soil, causing an increase in thermal resistivity, which in turn would lead to the cable temperature rising to a higher value than anticipated. For cable laid directly in the ground, a suitable de-rating factor should be applied or a lower maximum sustained conductor operating temperature assumed to take into account the possible effects of soil drying out.
